Title

Biomechanics of the diabetic foot and custom-made footwear: state-of-the-art design principles

Coauthors

van Netten JJBusch-Westbroek TE

Summary

Adequate pressure-relieving footwear is important to help prevent foot problems in people with diabetes. State-of-the-art principles in footwear design and biomechanics pressure relief and other innovations will be presented during this lecture

Introduction/ basics

This lecture is part of the symposium "State-of-the-art care of diabetic foot syndrome by an interdisciplinary team". The aim of this symposium is to discuss this topic from a variety of angles, combining scientific and clinical knowledge, to provide best-practice examples and practical solutions.

Material method; implementation/ process

For ulcer prevention, custom-made footwear is commonly prescribed to people with diabetes, in particular to those that have healed from a plantar foot ulcer and have foot deformity that limits the use of standard footwear. Custom-made footwear aims to redistribute pressures on the foot and reduced pressure at locations that are a high risk for ulceration (pressure points). International guidelines from the IWGDF report on the importance of custom-made footwear and insoles to prevent recurrence of plantar foot ulcers in patients in remission. Innovations in footwear technology include the use of plantar pressure measurements to guide design and modifications to the footwear that optimize the pressure relieving properties of the shoe. The efficacy of this approach has been tested in several trials.

Results

These trials show that barefoot or in-shoe plantar pressure measurements can improve the footwear of high-risk patients with diabetes, and can lead to better clinical outcomes in prevention.

Discussion/ conclusion; conclusion for the practice

Further innovations include the development of scientific-based protocols to help in clinical decision-making for the right type of footwear and for the design of custom-made footwear for different levels of foot complications. Other innovations include the testing and comparison of scientific-based pressure-based footwear design on plantar pressure relief, of which the results can help in moving towards designing the most optimal shoe for diabetic foot prevention. Other innovations will also be presented during this lecture
