

## Bio-inspired Exoskeleton

Kickstart® Walk Assist System is a neurorehabilitation device designed to accelerate walking recovery and functional improvement in stroke, multiple sclerosis, incomplete spinal cord injury, and those with other neurological conditions.

Using its proprietary Exotendon® technology, Kickstart provides stability and assistance to lift, swing and guide the leg properly for each step without using electronics. Exotendon functions like an artificial tendon to store and release energy throughout the user's gait cycle.

Presently, Kickstart® Clinical, Kickstart® Personal and Kidstart® Pediatric Walk Assist Systems have received medical device registrations and met the ISO13485 quality system requirement.
