

FACT SHEET – InsolePro Software

What is InsolePro? InsolePro is a workshop solution designed to provide visual support for the insole manufacturing process, helping technicians create insoles with precision and consistency.

What advantages does InsolePro offer you?

- True-to-scale projection of customer data directly onto the work surface
- Reduces transfer errors between the screen and the workbench
- Enables simultaneous viewing of foot shape, pressure distribution, and gait data
- Supports consistent and traceable insole production

InsolePro in the Customization Process

Various customer data sets can be displayed and combined, including: foot scan images, pressure maps from static analysis, and pressure maps from dynamic (gait) analysis.

- By overlaying these images, workshop staff can take into account not only the shape of the foot but also pressure points and how they change during walking.
- This integrated view supports informed decisions and enables a more precise and personalized insole manufacturing process.

These are the various dashboards and tools in InsolePro

- Orders: an overview of key order information
- Operator: print and camera settings, as well as user switching
- Users: displays all system users
- Statistics: displays, among other things, the percentage distribution of different insole types in a pie chart
- Customer History: all orders per customer
- Sales: displays completed orders that are ready for pickup
- Archive: stores orders that have already been completed
- Paint Tool: various drawing and measuring tools support the manufacturing process
