CONFIDENCE SOCKET – first completely remouldable temporary socket – can be fitted in an hour

Amparo (Berlin, Germany) have announced a revolution in temporary socket technology with their CONFIDENCE SOCKET: the first truly reformable interim socket helps amputees take their first steps. It makes the whole fitting process much easier and saves time, so that recent amputees can begin their rehabilitation quickly and in greater comfort. The CONFIDENCE SOCKET can be made in just one hour.

The amparo socket is moulded straight onto the stump – quite different from the traditional process. Manufactured from low-temperature thermoplastic, it can be re-fitted completely as the size of the stump alters. Nor does it require any complex machinery. All the necessary tools can be fitted into a single sports bag. Because of this “workshop in a bag”, technicians can travel both to hospitals and to people’s homes, as well as to remote regions, and provide patients with a prosthesis on the spot. And amputees can rely on a single socket for the entire duration of the healing and transition phases.
