#### Human Knee Explorer – more knowledge made visible

Effigos AG (Leipzig, Germany) will be providing information at OTWorld about their interactive app, the Human Knee Explorer, for use in initial and further training in orthopaedic disciplines. This learning, teaching and presentational app demonstrates the functional anatomy of the knee in a 3D environment. It contains details of more than 50 three-dimensional anatomical structures, as well as a prosthetic knee.

Alongside detailed and accurate portrayals of the structures, there are animations showing the processes involved in movement with and without prosthetic knees, together with a presentational tool and numerous opportunities to process and work on the material. Manufacturers can have their products integrated into the software and use the Human Knee Explorer for marketing purposes and training in the use of their products. The app is available for Windows PC, Mac and iPad.
