Eschler Textil GmbH

Velcro substrate system for braces and bandages

The Velcro fastenings from Eschler (Balingen, Germany) are used in a variety of braces and bandages. In order to be able to meet the requirements of customers working in the field of orthopaedics more quickly and flexibly, the knitted-fabric specialists have developed a dedicated Velcro system specially in time for OTWorld. It is based on Velcro material with a weight of 200 g/m², which will also be presented to the market for the first time. Their range of Velcro materials is completed with various coatings and linings that have been specially designed for medical and orthopaedic use. The product is available in two standard colours and can be obtained in small quantities.
