FLEXOR footbeds & pads

Extremely thin Resiflex kits from FLEXOR

The Spanish company, FLEXOR (Barcelona, Spain) are introducing some brand-new Resiflex kits, with soles and pads for individual orthopaedic inserts, shaped in a heat process. These inserts are extremely thin and suitable for almost any kind of shoe. They have been designed to treat commonly occurring pathologies in a cost-effective manner. They come with latex-gel pads that have been developed so as to save fitting time with the patient.

As an alternative to the usual hardness levels in grey and green, not to mention the more established red version, FLEXOR have now added a very new, softer line of salmon-coloured latex pads to the range, which offer additional cushioning if needed.

And finally, FLEXOR are introducing a home-grown, digital analytical system, that is supported by a digital footprint platform and a 3-D scanner.

FLEXOR heads a small group of companies, who, since 1963, have devoted themselves to the development of concepts and solutions for soles and components to be used in orthopaedic inserts. Their products are exported all over the world.
