Klaveness Ice Sole protects against falls in winter

Every winter, there are significant risks in Scandinavia of slipping on the ice and snow. This results in 300,000 people ending up in hospital as a result of a fall. One well-known solution is to wear shoe spikes or snow chains specially designed for footwear. These are, however, not allowed in shops, as the spikes damage the flooring. As a result, the Norwegian company Klaveness (Sandefjord, Norway), in collaboration with Nsize, have researched and developed a patented reversible-spike sole, which can be hooked

under the sole of the shoe and fastened at the back. This makes it a simple matter to swap between spikes and normal soles without the need for any tools.

The new Klaveness Ice Sole will be on show at OTWorld. It can be adapted for individual orders and to suit various styles.
