Versoteq 3D-Solutions

VersoCore by Versoteq 3D-Solutions – the future of 3D processing / finishing

Versoteq (Espoo, Finland) will be introducing at OTWorld their new VersoCore online platform for automatic 3D modelling. VersoCore prepares models on the basis of 3D scan data. These can then be printed in 3D or checked and revised in virtual space. The basic functions include interfaces for integration purposes, extrusion of the processed 3D data and the manual or automatic establishment of the cutting line. Functionality can be extended, using the VersoCore 'library'. With this platform, it is possible to produce tailor-made medical products, based on specific biometric information.
